Using excerpts from contemporary training manuals, this pocket manual is an insight into the preparation of the troops involved in Operation Overlord. The success of the D-Day landings on June 6, 1944, depended on thousands of troops carrying out their mission and the seamless coordination of the amphibious landings with paratrooper and glider assaults. The troops not only had to be trained up ready for their own roles, but to work alongside other troops, often coordinating activities and communicating with other troops while in unfamiliar terrain and under fire. This pocket manual brings together excerpts from Allied manuals used in the preparation for D-Day, including amphibious landings and managing beachheads, pathfinder, paratrooper, and glider pilot training, and infantry and armored fighting in the bocage countryside. "Chris McNab is a prolific writer who knows what he is doing, as this book shows; and this volume will fit well with its stable mates." —War History Online The Hawker Hurricane was the mainstay of the RAF during the early years of World War II. It saw extensive service in the Battle of

Britain, over the Mediterranean and even saw action on the Eastern Front. Reliable, sturdy, rugged and effective this fighter proved itself time and again in action against the Luftwaffe. With a 1,260 horsepower Merlin engine the Hurricane was, for its time, one of the best fighters ever produced. This detailed, technical manual reveals the technology behind the Hurricane's fighting ability. It examines the aircraft's engine, armament, controls, design and technical specifications to give a clear picture of the plane's strengths and limitations. Technical drawings, electrical plans and cockpit photographs support the text. The Hurricane II Manual is a facsimile of the original official workshop manual - used by the personnel who flew and maintained the aircraft - first published in the 1940s. Designed without horizontal stabilizers, the X-4 Bantam had a semi-tailless design that bore some resemblance to Germany's Me-163 rocket plane. The small, twin-jet craft relied on combined elevator and aileron surfaces, known as elevons, for pitch and roll control. The role of the X-4 was to explore the transonic speed zone, and to determine whether the design would lessen the stability and control problems affiliated with compressibility. Although two Bantams were built, only one proved mechanically sound. The second was flown over eighty times by Northrop, Air Force and NACA pilots. They learned that the X-4 was sensitive in pitch, and showed a tendency to hunt about all three axes as it approached Mach 1.0. Thus, the X-4's design proved a failure. Originally printed by Northrop, NACA and the USAF, this handbook provides a fascinating glimpse inside the cockpit of this experimental plane. The manual was recently declassified and is here reprinted in book form. The Hydrogen Generator consists of three major components: the liquid ammonia feed tank, the cracker coil assembly, and the hydrogen purifier. The delivery rate of the ultra-pure hydrogen product is infinitely variable up to 140 SCFH at 3 psig, with liquid ammonia input at 240 psig. The principle of the operation of the Hydrogen Generator is that gaseous ammonia feeding to the burner initially heats the cracker coils. Liquid ammonia is then pumped to the pre-heater (hydrogen product cooler) where it is vaporized, and then passes through the hot cracking coils where it dissociates into hydrogen and nitrogen. Pure hydrogen is forced through the diffuser on demand, while hydrogen-depleted gas is returned to the burner. By proper control, the burner is run on depleted gas alone at all levels of hydrogen demand. Thus, once operating, the system functions solely on liquid ammonia. (Author).
