Methods of Animal Experimentation, Volume V: Nutrition, Aging, and Artificial Organs is a collection of papers that deals with methods to be used in animal experiments to achieve cost effectiveness in their use. This collection discusses laboratory animals used in different experiments such as in nutritional research, aging studies, and artificial organ research. The papers describe the species of animals appropriate for the kind of experiment to be conducted and the criteria that should be followed in choosing a certain species. These criteria include their growth rate, stage of development, as well as existing performance variations. In determining test animals for aging experiments, the book recommends that complete data be available on the genetics of the species, strain, diet history, environmental factors, breeding, and spontaneous diseases to approximate the best test results. The book addresses that the aged are more susceptible to inputs than the young in terms of morphological and functional age.
