How can we determine the big ideas worth understanding? Why is understanding an important teaching goal, and how do we know when students have attained it? How can we create a rigorous and engaging curriculum that focuses on understanding and leads

to improved student performance in today's high-stakes, standards-based environment? Authors Grant Wiggins and Jay McTighe answer these and many other questions in this second edition of *Understanding by Design*. Drawing on feedback from thousands of educators around the world who have used the UbD framework since its introduction in 1998, the authors have greatly revised and expanded their original work to guide educators across the K-16 spectrum in the design of curriculum, assessment, and instruction. With an improved UbD Template at its core, the book explains the rationale of backward design and explores in greater depth the meaning of such key ideas as essential questions and transfer tasks. Readers will learn why the familiar coverage- and activity-based approaches to curriculum design fall short, and how a focus on the six facets of understanding can enrich student learning. With an expanded array of practical strategies, tools, and examples from all subject areas, the book demonstrates how the research-based principles of *Understanding by Design* apply to district frameworks as well as to individual units of curriculum. Combining provocative ideas, thoughtful analysis, and tested approaches, this new edition of *Understanding by Design* offers teacher-designers a clear path to the creation of curriculum that ensures better learning and a more stimulating experience for students and teachers alike. Literacy-it's not just for English teachers anymore. The new Common Core English Language Arts Standards aren't just for English teachers. Fluent reading and writing are critically important to the study of history/social studies, science, and technical subjects, too. What's more, the progress your students make is directly tied to their ability to process information they read and to express their ideas in writing. So how do you make literacy a focus of your teaching . . . without taking time away from essential content? This practical resource-packed with teacher-tested, CCSS-based sample lessons-shows you how, using the Backward Design approach to set and meet your goals. Each lesson template includes The teaching strategies you'll utilize Ways to incorporate technology and media Variations for differentiation and interdisciplinary connections Links to the work of major educational theorists Following these models, you'll set the CCSS in your sights and develop lessons that both meet standards and fit your classroom. Before you know it, you'll be infusing reading and writing across your curriculum in purposeful and meaningful ways. By using an issues-oriented approach, the new edition of this respected text grabs student interest with real-life issues that hit home. This text includes new coverage and pedagogy that encourages students to think critically about hot-button issues and includes outstanding new features that take students beyond memorization and encourage them to ask questions in new ways as they learn to interpret data. Show students how biology matters Biology's connections to real life are reflected in every chapter of this new edition, beginning with opening Impacts, Issues essays a brief case study on a biology-related issue or research finding and is revisited throughout the chapter, reminding students of the real-world significance of basic concepts. Additional, online exercises promote critical thinking about issues students will face as consumers, parents, and citizens. Link concepts from chapter to chapter Links to Earlier Concepts appear near the Key Concepts, to help students remember what they've learned in earlier chapters and apply it to the new material to come. At the beginning of each section, students are reminded of the earlier link that is most appropriate for their current. Here is a preview of what is inside this book: Introduction Abiogenesis Anaerobic Respiration Animal Behavior Cell Organelles Diffusion & Osmosis Dissolved Oxygen DNA Replication Endocrine System Endosymbiosis Enzymes Hardy Weinberg Equation Heredity Immune Systems Kingdoms Krebs Cycle Lipids Mendelian Genetics Mitosis and Meiosis Nucleic Acids Scientific Method Transcription and Translation Conclusion An excerpt from the book: Anaerobic respiration is how cells make energy when, as you may have guessed from the name, there is no available oxygen. In fact, for this process there is neither oxygen nor mitochondria present. The two processes that allow this to work are those of glycolysis and fermentation. In cellular respiration, what we normally see is glucose breaks down to pyruvate and from this process we net 2 ATP. Next, the pyruvate will go into the mitochondria and enter the Krebs cycle. In the process of being converted to acetyl CoA, CO₂ is given off and another 2 ATP are made. This energy is stored in NADH and FADH₂. Their electrons move into the electron transport chain which will move to oxygen to transform the product to water. In this, 23-34 ATP are made.
