Glencoe Algebra 2 strengthens student understanding and provides the tools students need to succeed from the first day your students begin to learn the vocabulary of algebra until the day they take final exams and standardized tests. College Algebra provides a comprehensive exploration of algebraic principles and meets scope and sequence requirements for a typical introductory algebra course. The modular approach and richness of content ensure that the book meets the needs of a variety of courses. College Algebra offers a wealth of examples with detailed, conceptual explanations, building a strong foundation in the material before asking students to apply what they've learned. Coverage and Scope In determining the concepts, skills, and topics to cover, we engaged dozens of highly experienced instructors with a range of student audiences. The resulting scope and sequence proceeds logically while allowing for a significant amount of flexibility in instruction. Chapters 1 and 2 provide both a review and foundation for study of Functions that begins in Chapter 3. The authors recognize that while some institutions may find this material a prerequisite, other institutions have told us that they have a cohort that need the prerequisite skills built into the course. "Algebra II Notes" RIGHT NOW! This is the second of
two volumes of a state-of-the-art survey article
collection which originates from three commutative
algebra sessions at the 2009 Fall Southeastern
American Mathematical Society Meeting at Florida
Atlantic University. The articles reach into diverse
areas of commutative algebra and build a bridge
between Noetherian and non-Noetherian commutative
algebra. These volumes present current trends in two
of the most active areas of commutative algebra: non-
noetherian rings (factorization, ideal theory,
integrality), and noetherian rings (the local
theory, graded situation, and interactions with
combinatorics and geometry). This volume contains
surveys on aspects of closure operations, finiteness
conditions and factorization. Closure operations on
ideals and modules are a bridge between noetherian
and nonnoetherian commutative algebra. It contains a

nice guide to closure operations by Epstein, but also contains an article on test ideals by Schwede and Tucker and one by Enescu which discusses the action of the Frobenius on finite dimensional vector spaces both of which are related to tight closure. Finiteness properties of rings and modules or the lack of them come up in all aspects of commutative algebra. However, in the study of non-noetherian rings it is much easier to find a ring having a finite number of prime ideals. The editors have included papers by Boynton and Sather-Wagstaff and by Watkins that discuss the relationship of rings with finite Krull dimension and their finite extensions. Finiteness properties in commutative group rings are discussed in Glaz and Schwarz's paper. And Olberding's selection presents us with constructions that produce rings whose integral closure in their field of fractions is not finitely generated. The final three papers in this volume investigate factorization in a broad sense. The first paper by Celikbas and Eubanks-Turner discusses the partially ordered set of prime ideals of the projective line over the integers. The editors have also included a paper on zero divisor graphs by Coykendall, Sather-Wagstaff, Sheppardson and Spiroff. The final paper, by Chapman and Krause, concerns non-unique factorization.
