Organic materials are potential important sources of micro and macro nutrients in agricultural soils environment (Hood, 2001). They affect physical, biological, chemical, and ecological processes in soil. They improve soil structural quality, soil water holding capacity, soil infiltration, soil organism biodiversity, and soil nutrient availability (FAO, 2005). The utilization of the animal and plant materials is not only an economic benefit for soil and crops but also for human being and his environment. Bio-organic Manure (BOM) is processed from some organic materials (animal or plant or combinations of all). Process of decomposition of homogeneous and heterogeneous organic materials will be rapidly undergoing some changes due to microbial functions, temperature control, and water actions. This is different from fresh organic fertilizer where natural decay process is brought about by the action of heterogeneous microbes present in the organic matter. Although Excerpt from Docking Report Manual: Guide to Fouling Organisms and Instructions Regarding the Docking Report The Navy is devoting much time and effort to the improvement of its formulas for ship bottom paints. Because many different factors control the amount of fouling and corrosion, new formulas should not be adopted for widespread service use until they are tested under service/ conditions. Since further improvement is guided by information which can be obtained only at the time of docking, it is essential that the docking reports be as complete and accurate as possible. The data they contain will be summarized for statistical analysis. This booklet was prepared to assist docking officers in filling out the present form especially in regard to estimating the extent of fouling, and identifying the marine life with which a ship is fouled.
