"Science is rooted in conversations," wrote Werner Heisenberg, one of the twentieth century's great physicists. In *Quantum Dialogue*, Mara Beller shows that science is rooted not just in conversation but in disagreement, doubt, and uncertainty. She argues that it is precisely this culture of dialogue and controversy within the scientific community that fuels creativity. Beller draws her argument from her radical new reading of the history of the quantum revolution, especially the development of the Copenhagen interpretation. One of several competing approaches, this version succeeded largely due to the rhetorical skills of Niels Bohr and his colleagues. Using extensive archival research, Beller shows how Bohr and others marketed their views, misrepresenting and dismissing their opponents as "unreasonable" and championing their own not always coherent or well-supported position as "inevitable." *Quantum Dialogue*, winner of the 1999 Morris D. Forkosch Prize of the *Journal of the History of Ideas*, will fascinate everyone interested in how stories of "scientific revolutions" are constructed and "scientific consensus" achieved. "[A]n intellectually stimulating piece of work, energised by a distinct point of view."—Dipankar Home, *Times Higher Education Supplement* "[R]emarkable and original. . . . [Beller's] arguments are thoroughly supported and her conclusions are meticulously argued. . . . This is an important book that all who are interested in the emergence of quantum mechanics will want to read."—William Evenson, *History of Physics Newsletter*

Koneru Ramakrishna Rao has played a leading role in advancing parapsychology in the United States, India, and around the world—serving as president of both the Indian Academy of Applied Psychology and the U.S.-based Parapsychological Association. He founded the *Journal of Indian Psychology* and served as editor of the *Journal of Parapsychology* for nearly two decades. He has authored many books, including *Basic Research in Parapsychology* (second edition, 2001, \$39.95) and *Consciousness Studies* (2002, \$75). Thirteen essays collected here honor his contributions to the field; they are written by Raos colleagues, students, and protgs on such topics as psychical research, prayer and healing, consciousness, dreams and clairvoyance. Also provided is a complete bibliography of Raos published writings. The book contains: coverage of five major topic areas in the NSW School Certificate test Energy, Force and Motion Atoms, Elements and Compounds Structure and Function of Living Things Earth and Space Ecosystems, Resources and Technology a chapter on Investigations and Problem Solving in Science to help with practical skills revision questions and chapter tests to help you remember important information a glossary and summary in each section of the book diagrams and illustrations to help your understanding a section to help you prepare for the School Certificate test a sample School Certificate test paper with answers answers to all questions The demand for higher education worldwide is booming. Governments want well-educated citizens and knowledge workers but are scrambling for funds. The capacity of the public sector to provide increased and equitable access to higher education is seriously challenged. This book contains the papers presented at the second World Scientific Congress of Golf. The overall theme of the congress is the application of science, scientific method and scientific research in golf. The congress is intended to provide a forum for scientists of different disciplines to meet and discuss their ideas and research and for practising coaches to interact with scientists. Science will have an even greater impact on the lives of our students. The lives of scientifically literate students will be enriched by their understanding, appreciation, and enjoyment of the natural world. To prosper in the near future, all students must become scientifically literate and embrace the notion of life-long learning in science. Without scientific literacy, it will become impossible for students to make informed decisions about the interrelated educational, scientific, and social issues that will confront them in the future. Intended for science teachers, teacher educators, researchers, and administrators, this volume is concerned with the innovative research that is reforming how science is learned in schools. The chapters provide overviews of current research and illustrate how the findings of this research are being applied in schools. This research-based knowledge is essential for effective science instruction. The contributors are leading authorities in science education and their chapters draw clear connections among research, theory, and classroom practice. They provide excellent examples from science classes in which their research has reformed practice. This book will help educators develop the scientific literacy of students. It bridges the gap between cutting-edge research and classroom practice to provide educators with the knowledge they need to foster students' scientific literacy. The essays in this book, like all other texts, have been written in a historical context that shapes both the themes and the prose styles of the authors. A close reading of these texts would in fact lead to many overlapping contexts of politics, social hierarchies, modern communications, and international relations, but we want to focus briefly on two contextual influences that carry the most obvious connections to this book: the wide-ranging public debate about the proper curriculum for American schools and universities, and the more specific debate among historians about new trends in historical scholarship. Experts from academia and government who are actively engaged in research in the area of risk communication present a compendium of cases that give information and allow the development of strategies to improve the communication of scientific information to the public. The cases span Western, Central and Eastern Europe, covering such areas as nuclear waste, heavy metal contamination, landfill siting, risk perception, global warming, international health for all, and more. The conclusions and recommendations presented here are being used to develop future activities to further explore this area of risk communication as an international study. Audience: Scientists, risk communicators, psychologists, toxicologists, health professionals, and anyone who has an interest in public communication on scientific uncertainty. In August 2003 over 400 researchers in the field of science education from all over the world met at the 4th ESERA conference in Noordwijkerhout, The Netherlands. During the conference 300 papers about actual issues in the field, such as the learning of scientific concepts and skills, scientific literacy, informal science learning, science teacher education, modeling in science education were presented. The book contains 40 of the most outstanding papers presented during the conference. These papers reflect the quality and variety of the conference and represent the state of the art in the field of research in science education. "REA: the test prep AP teachers recommend." A guide to taking the Advanced Placement exam in chemistry, featuring a review of major chemistry concepts, practice and diagnostic tests, test-taking strategies, an overview of the test, and practice problems. The authors describe mostly in non-technical language the development of a new scientific paradigm based on nonlinear deterministic dynamics and fractal geometry. The concepts from these two mathematical disciplines are interwoven with data from the physical, social and life sciences. In this way rather sophisticated mathematical concepts are made accessible through experimental data from various disciplines, and the formalism is relegated to appendices. It is shown that the complexity of natural and social phenomena invariably lead to inverse power law

distributions, both in terms of probabilities and spectra. This book tries to show how to think differently about familiar phenomena, such as why the bell-shape curve ought not to be used in teaching or in the characterization of such complex phenomena as intelligence. Many countries have established or revised standards to describe what teachers are supposed to teach and students are expected to learn. More recently, the emphasis has shifted to considerations of how standards can be operationalized in order to make the outcomes of educational efforts more tangible. This book is the result of a symposium held in Kiel, that was arranged by two science education groups, one at the IPN (Leibniz-Institute for Science and Mathematics Education at the University of Kiel) in Germany and the other at the University of York, UK. The seminar brought together renowned experts from 12 countries with different notions of the nature and quality of learning outcomes. The aim was to clarify central conceptions and approaches for a better understanding among the international science education community. The book is divided into five parts. In Part A, the organizers set the scene, describing the rationale for arranging the symposium. Part B provides a broad overview about different approaches, challenges, and pitfalls on the road to the clarification of meaningful and fruitful learning outcomes. The set of papers in Part C provides deep insights into different, although comparable approaches which aim to frame, to assess, and to promote learning and learning outcomes in science education. Smaller projects are presented as well as broad, coordinated national programs. The papers in Part D outline the individual historical development from different national perspectives, reflecting the deficits and problems that led to current reforms. Finally, a summary of the organizers analyses the conclusions from different vantage points.
